Using `auto` columns is very convenient when it is the largest cell in that column:

```
#table(
    columns: (auto, auto, auto),
        align: horizon + center,
        table_diagbox[Names][Properties], [*Can Walk*], [*Can Run*],
        [*Character A*], [Yes], [No],
        [*Character B*], [No], [No]
)
```

Properties Names	**Can Walk**	**Can Run**
Character A	Yes	No
Character B	No	No

This also work when the diagbox is not the largest cell:

```
#table(
    columns: (auto, auto, auto),
    align: horizon + center,
    table_diagbox[Names][Properties], [*Can Walk*], [*Can Run*],
    [*Long Long Long Character A*], [Yes], [No],
    [*Long Long Long Character B*], [No], [No]
)
```

Properties Names	**Can Walk**	**Can Run**
Long Long Long Character A	Yes	No
Long Long Long Character B	No	No

You can also have diagonal lines starting from the bottom, using `start: bottom`:

```
#let third_column_size = 5em;
#table(
    columns: (auto, auto, third_column_size),
    align: horizon + center,
    table_diagbox[Names][Properties], [*Can Walk*], [*Can Run*],
    [*Character A*], [Yes], [No],
    [*Character B*], [No], table_diagbox(start: bottom)[A][B]
)
```

Properties Names	**Can Walk**	**Can Run**
Character A	Yes	No
Character B	No	A B

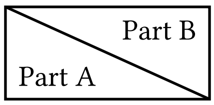
If your table has a custom `inset` (inner padding) property, make sure to pass it along:

```
#let third_column_size = 5em;
#let inset = 20pt;
#table(
    columns: (auto, auto, third_column_size),
    align: horizon + center,
    inset: inset,
    table_diagbox(inset: inset)[Names][Properties], [*Can Walk*], [*Can Run*],
    [*Character A*], [Yes], [No],
    [*Character B*], [No], table_diagbox(inset: inset, start: bottom)[A][B]
)
```

Properties Names	**Can Walk**	**Can Run**
Character A	Yes	No
Character B	No	A B

You may specify a standalone (table-less) diagbox by wrapping it in a simple grid

```
#grid(grid_diagbox[Part A][Part B])
```



Additionally, all the parameters which can be used on `grid.cell` are supported. The stroke parameter can be used to customize the diagonal line with the `diag` key:

```
#grid(
    grid_diagbox(stroke: (diag: yellow + 2pt, rest: teal + 3pt))[Part A][Part B])
```
